Umbraco Implementation Test

We would like you to download, install and set up a new Umbraco website, create a single page inheriting from a base page and build an MVC form that sends an email. Please use the latest LTS version of Umbraco.

We are looking to see how you get on with Umbraco, how you would build a website solution and how much you can achieve in a short timeframe.

Please do not use Umbraco Forms to complete this challenge.
https://www.nuget.org/packages/Umbraco.Forms

Once you have completed it, please send the code and database over to us and we can review it. Preferably, upload the code and database to a public git repository and share the link with us for review.
